	Student Exploration: 3D Eclipse
Vo	cabulary: eclipse, lunar eclipse, path of totality, penumbra, solar eclipse, umbra
Pri	or Knowledge Questions (Do these BEFORE using the Gizmo.)
1.	Have you ever seen an eclipse? If so, describe what you saw
2.	About how often do you think eclipses happen?
If y and tim twice The Mod (be see	wou see a two-dimensional image of the Earth, Moon, d Sun, you might predict that an eclipse occurs every e the Moon passes in front of or behind Earth, or about ce a month. However, eclipses occur much more rarely. Top view Top view Top view Top view Top view Top view Side view
	Set the Simulation speed slider to a middle value, and click Play (). Based on the top view on the SIMULATION pane, describe the motions of the Sun, Earth, and Moon.
2.	Click Reset (2), and then click Play again. This time, focus on the side view at the bottom of the SIMULATION pane. What do you notice about the Moon's orbit?

	Get the Gizmo ready:	
Activity A:	Click Reset.	
Solar eclipse	 Under Shadows, select Moon. 	
	• Set the Moon angle to 0.0°.	

Introduction: There are two parts to the Moon's shadow. The **umbra** is the central, darkest portion of the shadow. An observer standing in the umbra cannot see the Sun. The **penumbra** surrounds the umbra. An observer in the penumbra sees part of the Sun. Only the umbra is shown in the *3D Eclipse* Gizmo.

Question: What controls whether a solar eclipse will occur?

1.		ve: Click Play and then Pause (II) when the Moon is directly between the Earth and If you go too far, you can click the Back button to step back.)
	A.	What do you notice about the Moon's shadow?
	В.	Under Views, select Earth. What do you see?
		Any person standing in the Moon's shadow will experience a solar eclipse . During a total solar eclipse, the entire disk of the Sun is blocked by the Moon.
2.		ve: Set the Simulation speed to a lower setting and click the Back button until just the Moon's shadow crosses Earth's surface. Click Play and observe.
	A.	What do you notice?
	В.	The path the Moon's umbra traces across Earth's surface is called the path of totality . What would you see if you were standing in the path of totality?
3.		d: Click Reset . Set the speed to a higher setting and click Play . Use the Gizmo to nine the dates of the first six solar eclipses of the year. Record these dates below.
	Do you	u think solar eclipses really happen this often? Explain

(Activity A continued on next page)

Activity A (continued from previous page)

4.	Explore: Click Reset . A solar eclipse does not occur every month because the Moon's orbit is tilted 5.14° relative to Earth's orbit.		
	To model this, set the Moon angle to 5.1°. Play the simulation until January 9. Click Pause reduce the speed, and click Play . What do you notice about the path of totality now?		
5.	Explore: Advance the simulation to February 8, and again play the simulation at a low		
	speed. Does the umbra cross Earth's surface this time?		
	In this situation, a total solar eclipse will not be visible from any location on Earth's surface.		
6.	Record: Use the Gizmo to find the dates of the next three solar eclipses. Be sure to check carefully whether the Moon's umbra crosses Earth's surface. Record these dates below.		
	Do you think this frequency of solar eclipses is more realistic? Explain.		
7.	On your own: Experiment with different Moon angle values. How does the angle of the Moon's orbit affect the number of solar eclipses that occur in a year?		
8.	On your own: Return the Moon angle to 5.1°, and increase the Moon distance to 1.50.		
	How does increasing the Earth-Moon distance affect the occurrence of total solar eclipses?		

Activity B: Get the Gizmo ready: Click Reset Und

Lunar eclipse

• Click Reset. Under Shadows, select Earth.

Introduction: A **lunar eclipse** occurs when the Moon goes into Earth's shadow. If the Moon goes into Earth's penumbra, it is called a *penumbral lunar eclipse*. If the Moon goes into Earth's umbra, it is a *total lunar eclipse*. A *partial lunar eclipse* occurs when only part of the Moon goes into Earth's umbra. (Note: Earth's penumbra is not shown in the Gizmo.)

Question: What controls whether a lunar eclipse will occur?

1.	Observe: Set the Moon angle to 0.0°. Click Play, and then click Pause when the Moon is in
	Earth's shadow. Select the Moon view. What do you see?
2.	Observe: Set the speed to a lower setting and click the Back button until just before Earth's shadow crosses the Moon. Click Play and describe what you see.
3.	Infer: Select the Earth view. Who on Earth would be able to see the lunar eclipse? Explain your answer.
4.	Record: Click Reset and select the Moon view. Set the speed to a higher setting and click Play . Use the Gizmo to determine the dates of the first six lunar eclipses, and record below.
	Do you think lunar eclipses really happen this often? Explain.

(Activity B continued on next page)

Activity B (continued from previous page)

5.	Explore: Click Reset . Set the Moon angle to 5.1°. Play the simulation until January 24. Click Pause , set the speed to a low value, and click Play .			
	A.	Is there a lunar eclipse this time?		
	B.	Why not? (Hint: Look at the side view on the bottom of the SIMULATION pane.)		
6.	is actua	Use the Gizmo to find the dates of the lunar eclipses in one year. Be sure the Moon ally darkened by Earth's shadow for each eclipse. Label each eclipse a total eclipse is completely darkened) or a partial eclipse (only part of the moon is darkened).		
	Do you	think this frequency of lunar eclipses is more realistic? Explain		
7.		and discuss: A person living in North America can see 15 lunar eclipses in the 2010–ecade. In the same time period, only two solar eclipses can be observed in North a.		
		Ill more lunar eclipses than solar eclipses be visible from North America in this ? If possible, discuss your answer with your classmates and teacher.
