## Student Exploration: Sine Function

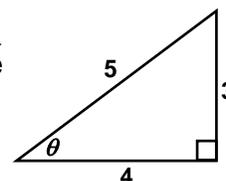

**Vocabulary:** odd function, period, radian, reference triangle, sine, trigonometric function, unit circle

**Prior Knowledge Questions** (Do these BEFORE using the Gizmo.)

1. The **sine** of angle  $\theta$  of a right triangle is the length of the opposite leg divided by the hypotenuse.

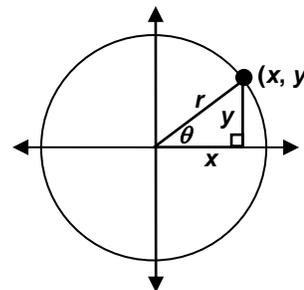

$$\sin(\theta) = \frac{\text{opposite}}{\text{hypotenuse}}$$

The legs of the right triangle to the right have lengths of 3 units and 4 units, and the hypotenuse is 5 units.

What is the sine of angle  $\theta$ ?  $\sin(\theta) =$  \_\_\_\_\_

2. A right triangle is placed in a circle whose center is at the origin of a coordinate plane, as shown to the right.

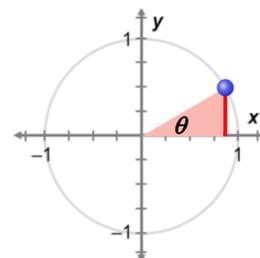

A. What is  $\sin(\theta)$ ?  $\sin(\theta) =$  \_\_\_\_\_

B. What is  $\sin(\theta)$  if  $r = 1$ ?  $\sin(\theta) =$  \_\_\_\_\_

### Gizmo Warm-up

The sine function  $y = \sin(\theta)$  is a **trigonometric function**. When  $\theta$  is in standard position, with its vertex at the center of a circle,  $\sin(\theta)$  is the  $y$ -value of the point where  $\theta$  intersects the circle. In the *Sine Function* Gizmo, you will explore the sine function and its graph.

1. On the **SINE** tab, turn on **Show reference triangle**. Then, with **Degrees** selected, drag the slider slowly from  $0^\circ$  to  $180^\circ$ .

A. What happens to the value of  $\sin(\theta)$  as  $\theta$  goes from  $0^\circ$  to  $180^\circ$ ?

\_\_\_\_\_

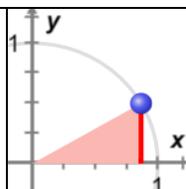

B. When does the maximum value of  $\sin(\theta)$  occur? \_\_\_\_\_

2. Explain why the behavior of sine from  $0^\circ$  to  $180^\circ$  makes sense, based on the unit circle.

\_\_\_\_\_

\_\_\_\_\_

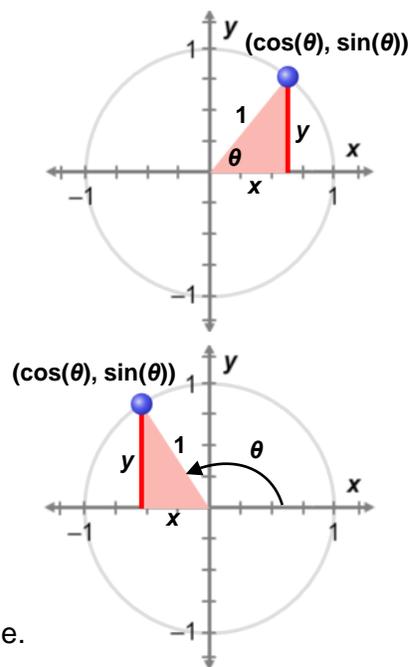

<p><b>Activity A:</b> <b>The basics of sine</b></p>	<p><u>Get the Gizmo ready:</u></p> <ul style="list-style-type: none"> <li>• On the <b>SINE</b> tab, be sure <b>Degrees</b> and <b>Show reference triangle</b> are selected.</li> <li>• Set <math>\theta</math> to <math>0^\circ</math>.</li> </ul>	
---	--	---

The circle shown in the Gizmo has a radius of 1, so it is a **unit circle**. Angle  $\theta$  is formed by the radius of the circle and the positive  $x$ -axis. The sine of  $\theta$  is the  $y$ -value of the corresponding point on the unit circle.

The right triangle formed by the perpendicular segment drawn from the terminal ray of  $\theta$  to the  $x$ -axis is called a **reference triangle**.

1. Set  $\theta$  to  $0^\circ$ , so the blue point is at  $(1, 0)$ . (To quickly set  $\theta$  to a specific value, type the value in the text box, and hit **Enter**.) Then drag the point counterclockwise around the circle once.

- A. When is  $\sin(\theta)$  positive? \_\_\_\_\_
- B. When is  $\sin(\theta)$  negative? \_\_\_\_\_
- C. Explain why that makes sense, based on the unit circle.

---

---

- D. Describe how the  $y$ -coordinate changes in one full rotation around the circle.

---

- E. What do you think will happen to the value of  $\sin(\theta)$  if you keep dragging the point around the circle? \_\_\_\_\_

Why? \_\_\_\_\_

---

Check your answer in the Gizmo.

- F. How often do the values of the sine function repeat? \_\_\_\_\_

This is called the **period** of the sine function. A function that repeats in regular intervals like this is *periodic*.

**(Activity A continued on next page)**

### Activity A (continued from previous page)

2. Set  $\theta$  to  $90^\circ$ . Notice that  $\sin(90^\circ) = 1$ .

A. List three angles greater than  $90^\circ$  with a sine of 1. \_\_\_\_\_

B. List three angles less than  $90^\circ$  with a sine of 1. \_\_\_\_\_

C. Justify your answers above. \_\_\_\_\_  
\_\_\_\_\_

D. Drag the point on the unit circle to check your answers above. Then fill in the blanks.

$$\sin(90^\circ) = \sin(90^\circ + \underline{\hspace{2cm}}) = \sin(90^\circ + \underline{\hspace{2cm}}) = \sin(90^\circ + \underline{\hspace{2cm}})$$

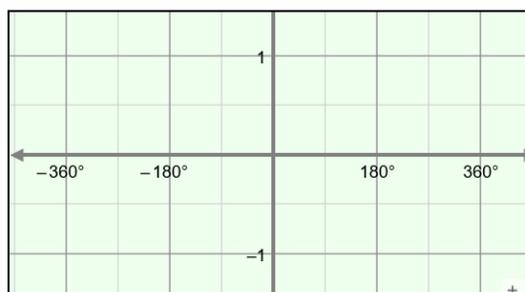

$$\sin(90^\circ) = \sin(90^\circ - \underline{\hspace{2cm}}) = \sin(90^\circ - \underline{\hspace{2cm}}) = \sin(90^\circ - \underline{\hspace{2cm}})$$

E. In the Gizmo, check that this relationship is true for angles other than  $90^\circ$ . Then fill in the blank to generalize this relationship.  $\sin(\theta) = \sin(\theta \pm (\underline{\hspace{2cm}}n)^\circ)$

F. The sine function is  $y = \sin(\theta)$ . This means that, when you graph it,  $\theta$  goes on the x-axis and  $\sin(\theta)$  on the y-axis.

What do you think the graph of  $y = \sin(\theta)$  looks like? Sketch your graph to the right.

After you are done, select **Show curve** in the Gizmo. Adjust your sketch as needed.

3. Angles can be measured in **radians** instead of degrees. A radian is a unit of angle measure, such that one full rotation ( $360^\circ$ ) equals  $2\pi$  radians.

A. If  $360^\circ = 2\pi$ , what is the radian measure of a  $180^\circ$  angle? \_\_\_\_\_

B. A  $30^\circ$  angle is  $\frac{1}{6}$  of  $180^\circ$ . What does  $30^\circ$  equal in radians? \_\_\_\_\_

C. Fill in the radian measure equal to each degree measure below. Check your answers in the Gizmo. (Select **Degrees**, type the degree measure, and select **Radians**.)

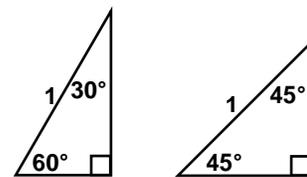

<b>Degree measure</b>	$0^\circ$	$30^\circ$	$45^\circ$	$60^\circ$	$90^\circ$
<b>Radian measure</b>					

D. State the identity  $\sin(\theta) = \sin(\theta \pm (360n)^\circ)$  using radians. \_\_\_\_\_

<b>Activity B:</b> <b>The sine function and identities</b>	<u>Get the Gizmo ready:</u> <ul style="list-style-type: none"> <li>On the <b>SINE</b> tab, be sure <b>Show curve</b> and <b>Show reference triangle</b> are turned on.</li> <li>Select <b>Degrees</b> and <b>Common angles only</b>.</li> </ul>	
---	---	--

1. Label the legs of the 30-60-90 and 45-45-90 triangles to the right with their lengths. (Hint: If you don't remember these values, use the Pythagorean Theorem. The short leg of the 30-60-90 triangle is exactly half of the hypotenuse.)

2. Start with  $\theta$  at  $0^\circ$ , and drag the point on the circle counterclockwise from  $0^\circ$  to  $180^\circ$ .

A. Fill in the table to the right with the sine values of  $30^\circ$ ,  $45^\circ$ , and  $60^\circ$ .

$\theta$	$30^\circ$	$45^\circ$	$60^\circ$
$\sin(\theta)$			

B. What reference triangle (30-60-90 or 45-45-90) would you use for each angle below?

$30^\circ$  \_\_\_\_\_  $45^\circ$  \_\_\_\_\_  $60^\circ$  \_\_\_\_\_

C. Fill in the table to the right with the sine values of  $120^\circ$ ,  $135^\circ$ , and  $150^\circ$ .

$\theta$	$120^\circ$	$135^\circ$	$150^\circ$
$\sin(\theta)$			

D. What reference triangle (30-60-90 or 45-45-90) would you use for each angle below?

$120^\circ$  \_\_\_\_\_  $135^\circ$  \_\_\_\_\_  $150^\circ$  \_\_\_\_\_

E. For the angles above, what is true about  $\sin(\theta)$  for the same reference triangle?

\_\_\_\_\_

3. Turn off **Common angles only**. Set  $\theta$  to  $0^\circ$ . Drag the point around the circle.

A. In which quadrants is sine positive? \_\_\_\_\_ negative? \_\_\_\_\_

B. Explain why, using the unit circle. \_\_\_\_\_

\_\_\_\_\_

C. Use what you know about reference triangles and quadrants to find the sine values.

$\sin(210^\circ) =$  \_\_\_\_\_  $\sin(315^\circ) =$  \_\_\_\_\_  $\sin(480^\circ) =$  \_\_\_\_\_

**(Activity B continued on next page)**

**Activity B (continued from previous page)**

4. Set  $\theta$  back to  $0^\circ$ . Drag the point around the circle. Examine pairs of angles whose measures add to  $180^\circ$ , or  $\pi$  radians (for example,  $60^\circ$  and  $120^\circ$ , or  $210^\circ$  and  $-30^\circ$ ).

A. What do you notice about their sine values? \_\_\_\_\_  
\_\_\_\_\_

B. Two angles have a sum of  $180^\circ$ . If one angle is  $\theta$ , what expression represents the other angle? \_\_\_\_\_

C. Fill in the blanks below to show how the sine values of angles that add to  $180^\circ$  relate to each other. (Write it once in degrees, and once in radians.)

$\sin(\theta) =$  \_\_\_\_\_       $\sin(\theta) =$  \_\_\_\_\_

5. Set  $\theta$  back to  $0^\circ$ . Drag the point around the circle.

A. Examine pairs of opposite angles (for example,  $30^\circ$  and  $-30^\circ$ ). What is true about their sine values? \_\_\_\_\_

B. Use what you noticed to write an equation about the sine values of opposite angles.  
\_\_\_\_\_

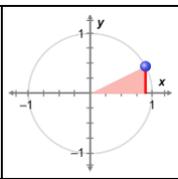

This makes sine an **odd function**, and its graph is symmetric about the origin.

C. Examine pairs of angles that are  $180^\circ$  apart (for example,  $30^\circ$  and  $210^\circ$ ). What is true about their sine values? \_\_\_\_\_  
\_\_\_\_\_

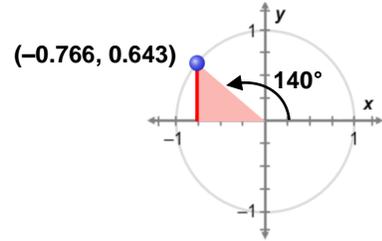

D. Use what you noticed to write two equations to show how the sine values of angles that are  $180^\circ$  apart are related. (Write one in degrees, and one in radians.)  
\_\_\_\_\_  
\_\_\_\_\_

E. It is also true that  $\sin(\theta) = -\sin(360^\circ - \theta) = -\sin(2\pi - \theta)$ . Explain why this makes sense, using the unit circle.  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

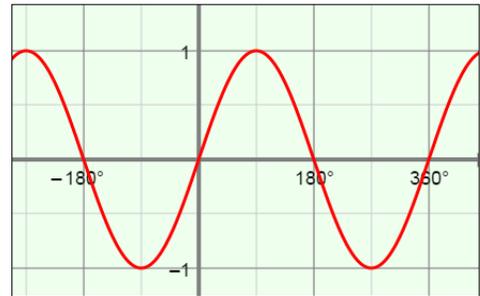

<b>Activity C:</b> <b>Practice with the sine function</b>	<u>Get the Gizmo ready:</u> <ul style="list-style-type: none"> <li>On the <b>SINE</b> tab, select <b>Degrees</b>.</li> </ul>	
--	--	---

1. The angle shown on the unit circle to the right has a measure of  $140^\circ$ .

A. What is  $\sin(140^\circ)$ ? \_\_\_\_\_

B. The graph of  $y = \sin(\theta)$  is shown to the right. Plot and label the point that shows  $\sin(140^\circ)$  on this graph. Check in the Gizmo.

C. Plot three other points on the graph with a y-value of 0.643. Write the coordinates of the points below. Then check in the Gizmo.

\_\_\_\_\_

\_\_\_\_\_

D. Plot four points on the graph with a y-value of  $-0.643$ . Write the coordinates of the points below. Then check in the Gizmo.

\_\_\_\_\_

2. Give the sine value of each angle below. Then list four different angles (two positive and two negative) with the same sine value. Check your answers in the Gizmo.

A.  $\sin\left(\frac{\pi}{6}\right) =$  \_\_\_\_\_ Angles with same sine value: \_\_\_\_\_

B.  $\sin\left(\frac{\pi}{4}\right) =$  \_\_\_\_\_ Angles with same sine value: \_\_\_\_\_

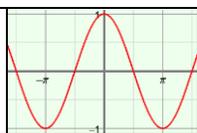

C.  $\sin\left(\frac{\pi}{3}\right) =$  \_\_\_\_\_ Angles with same sine value: \_\_\_\_\_

3. Use the fact that  $\sin(25^\circ) \approx 0.423$  to find each value. Check your answers in the Gizmo.

A.  $\sin(-25^\circ) \approx$  \_\_\_\_\_ C.  $\sin(155^\circ) \approx$  \_\_\_\_\_ E.  $\sin(335^\circ) \approx$  \_\_\_\_\_

B.  $\sin(-155^\circ) \approx$  \_\_\_\_\_ D.  $\sin(-385^\circ) \approx$  \_\_\_\_\_ F.  $\sin(-205^\circ) \approx$  \_\_\_\_\_

<b>Extension:</b> <b>Sine and cosine</b>	<u>Get the Gizmo ready:</u> <ul style="list-style-type: none"> <li>Select the <b>COSINE</b> tab.</li> </ul>	
---	---	---

1. The cosine of angle  $\theta$  in a right triangle is the length of the adjacent leg divided by the hypotenuse. On the unit circle,  $\cos(\theta)$  is the x-value of the point where  $\theta$  intersects the circle.

$$\cos(\theta) = \frac{\text{adjacent}}{\text{hypotenuse}}$$

Drag the point counterclockwise. How does the x-coordinate change in one full rotation?

---

---

2. Set  $\theta$  to  $0^\circ$ . Drag the point around the circle. Examine pairs of angles whose measures add to  $90^\circ$ . (Be sure to look at angles with both positive and negative measures.)

A. What do you notice about the sine of one angle and the cosine of the other?

---

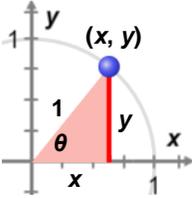

B. Two angles add to  $90^\circ$ . If one angle is  $\theta$ , what is the other angle? \_\_\_\_\_

C. Write two equations to summarize how the sine and cosine values of angles that add to  $90^\circ$  relate to each other.

$\sin(\theta) =$  \_\_\_\_\_  $\cos(\theta) =$  \_\_\_\_\_

3. If  $a$  and  $b$  are the legs of a right triangle with hypotenuse  $c$ , then the Pythagorean Theorem states that  $a^2 + b^2 = c^2$ .

A. Use the Pythagorean Theorem to write an equation for the reference triangle shown to the right. \_\_\_\_\_

B. Use  $\cos(\theta)$  and  $\sin(\theta)$  to write the *Pythagorean Identity*. \_\_\_\_\_

4. Use the Pythagorean Identity to find each value. Show your work, and check in the Gizmo.

A.  $\sin(\theta) = \frac{1}{2}$   $\cos(\theta) =$  \_\_\_\_\_ B.  $\cos(\theta) = 0.819$   $\sin(\theta) \approx$  \_\_\_\_\_
